

Имофераза®

Cream for specialised skin care in the region of cicatrice, scar

The company LLC "NPO Petrovax Pharm", the manufacturer of original medicinal products, has developed a highly effective cosmetic product for specialised skin care in the region of cicatrices, scars.

The Active molecule of the cream is Imoferaza®

The enzyme hyaluronidase is included in the composition of the cream. Due to the use of innovative technologies, a scientist from LLC "NPO Petrovax Pharm" managed to stabilize the enzyme, now this provides the complex action and long-term effect. Stabilized hyaluronidase inhibits formation of excessive connective tissue, and contributes to the decrease of edema in the region of cicatrice, scar.

When to apply:

Cicatrice, scar may develop injury of skin, received from trauma, surgery, burns, cosmetic procedures and acneiform rash (pitted facial scar). Using the cream Imoferaza® for 4-8 weeks may decrease the possibility of the development of rough scar after skin epithelization and make already formed cicatrice and pitted facial scar less noticeable.

The effects of using the cream in formed cicatrices, scars and after skin epithelization:

- Recovery of barrier-protective skin function in the projection of cicatrice, scar
 - Decrease in redness and hyperpigmentation
 - Decrease in senses of discomfort: tightness, dryness, burning
 - Increase in elasticity of scar tissue
 - Decrease in possibility of the formation of profound scar after the cicatrization (epithelization)
- When the scar is formed, use of the cream may help to make the scar less noticeable!

Recommendations on application of the cream in formed cicatrices or to prevent them:

- Apply a thin layer of the cream on clear skin by using massaging movements 2 times a day
- Duration of application is 4-8 weeks.
- The cream may be used for a longer time period, if appropriate
- The cream should be used after complete skin epithelization (cicatrization) (generally at least 2-3 weeks after injury)

First results of application of the cream are noticeable 4 weeks after use.²

Regular using use of the cream Imoferaza® is important to achieve the best results!

Safety and ease of application:

- The cream passed strict dermatological control, and causes no skin-irritation and allergic effect³
- Contains no parabens and fragrance components
- Requires no special preperation of skin ahead of application
- Quick absorption into skin
- Leaves no marks on clothes

The objective evaluation of skin condition in the region of hypertrophic scar following use of the cream Imoferaza® has demonstrated:⁴

- Decrease in the height of cicatrice, scar (2.1 times on average)
- Decrease in the levels of colour intensity of cicatrice, scar
- Increase in elasticity of cicatrice, scar
- Increase in skin humidity in the region of cicatrice, scar

After 8 weeks of the application of the cream Imoferaza®,⁴ you should notice improved scar appearance.⁴

Frequently-asked questions FAQ:

- ?** **What is pitted facial scar?**
Pitted facial scar is a skin cosmetic defect, which is an acneiform rash sequela (acne). Most frequent manifestations of pitted facial scar are redness, depigmentation, scars.

- ?** **When is it possible to begin using the cream upon removal of surgical sutures? What may be done to make the postsurgical trace less noticeable?**

Follow the recommendations of your doctor to prevent infection or traumatization of the region of the postsurgical wound. Upon complete epithelization (cicatrization) begin using the cream Imoferaza® to decrease the possibility of the formation of rough cicatrice, scar, redness, sense tightness, discomfort - dryness and itching after removal of surgical sutures.

- ?** **Will the cream Imoferaza® help in cases of predominant cicatrice caused by old trauma?**

The active enzyme, contained in the cream, affects the structure of scar tissue, regardless of the time period of scar tissue. The cream helps to reduce thickness and height of scar tissue, to decrease senses of tightness, desquamation and itching in compliance period Use as directed.

- ?** **Is it possible to apply the cream more frequently for more efficacy?**

This is not necessary. The enzymic stabilization provides high activity and prolonged action period. Therefore, it is sufficient to apply the cream 2 times a day.

- ?** **Are special conditions in using the cream required? Is dressing on the affected region required?**

The cream is very convenient in application period, the cream is rapidly absorbed, and does not require preliminary skin preparation, or supplementary usage conditions.

The effects of using the cream on pitted facial scar (acneiform rash sequelae):

- Improvement of skin appearance in trouble regions
 - Decrease in redness and hyperpigmentation
 - Smoothing of skin texture
 - Decrease in skin tension
- In severe forms of pitted facial scar use combination of laser exposure and further care with the cream Imoferaza®.¹

Recommendations on application of the cream in pitted facial scar (acneiform rash sequelae):

1. Clean your skin using your day-to-day product.
2. Wipe your skin with a toner, if you use it.
3. Apply the cream Imoferaza® dotted on the traces of pitted facial scar: redness, unevenness.
4. After 3 minutes apply the cream for everyday use or tint.

Do not apply on inflamed portions!

First results of application of the cream are noticeable 4 weeks after use.²
